Our surrounding biodiversity

Biodiversity

Biodiversity refers to all living beings (micro-organisms, plants, animals) and the ecosystems in which they live: lakes, mangroves, rivers, mountains, etc. In reality, there are three levels of biodiversity: the diversity of species, genes and ecosystems.

Look at the landscape around you

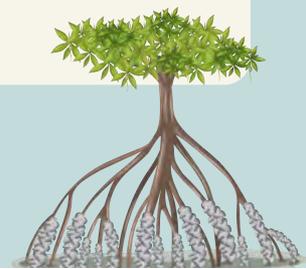

Below, describe in a few sentences the landscape around your school and make a group drawing (to be sent to us by email) to share with the other tribes. You can add comments to the drawing.

The youngest
can draw!

What animal species do you observe around your tribe?

What are the corresponding habitats for the species mentioned above?

What are their predators?

What plant species can you observe?

The youngest can draw!

A species is a group of more or less similar living beings that can reproduce with each other.

Is there an emblematic species in your environment, region or country?

Write below a few words about this species that we would like to discover! Is it threatened or has it disappeared? Why or why not?

An ecosystem is a group of living things that live in an environment. There are many different species in one ecosystem, and many different ecosystems on Earth, such as the Arctic ice pack or the savannah in Africa. The ocean is an ecosystem of fish, starfish and whales that eat each other and form a food chain.

Find all the infographics in the kit "Inspire by Nature, committed to action!"

Share your actions and inspire the other tribes !!!!!

What are you doing to protect or develop biodiversity: vegetable garden, garden, nest box, insect hotel?

Send us an email to: education@spindriftforschools.com and tell us about your action in a few words, with drawings or photos to spread and share with the other tribes!

You will win a new (virtual) totem pole to collect!
